### Rolling 20 Quarter Returns for 10 Years Ended June 30, 2017

**Disclosure:** Past performance is not a guarantee of future performance. Returns presented above include both actual client performance and hypothetical (backtested) performance.

**Actual client performance:** Beginning October 2009, actual client net composite returns are used. The net client composite returns include all internal accounts managed by Alpha Investment Management at various custodians that pay Alpha advisory fees ranging from 0.8% to 2.0% annually, and as such, individual results may vary. The Alpha client composite returns are calculated using the time-weighted rate of return method. The monthly composite level performance is calculated by asset-weighting portfolio performance, using end of month market values. Trade date accounting is used for calculation and valuation purposes. The composite returns are net of all fees and trading expenses and reflect reinvestment of dividends, interest and capital gains. Performance results do not reflect the impact of taxes.

A model portfolio of the same name as this strategy may be managed by Alpha and offered by investment advisors at various trading/investment platforms, TAMPs, and/or custodians outside the parameters of the internal Alpha client composite returns. Assets invested in such model portfolios may experience significant dispersion in returns from those of the internal Alpha client composite. The causes of dispersion may include, but are not limited to, higher or lower advisory fees, custodial fees, trading expenses, the date on which a client engaged Alpha's investment management services, and the preference/availability of funds used to implement the strategy (i.e. ETFs vs. mutual funds) at the custodial level.

**Hypothetical (backtested) performance:** Returns presented prior to October 2009 are hypothetical (backtested) and represent a reduction in gross returns of 2.20% annually for fees and expenses, applied quarterly, which would be expected in a real-time internally managed account. Actual bond funds expenses are incorporated in the hypothetical data. (Alpha's maximum advisory fee is 2% per annum. The additional reduction of .20% is to approximate the effect of mutual fund expenses during the fourth quarter of each year not already incorporated in the hypothetical returns.) Returns assume reinvestment of dividend and interest. Performance results do not reflect the impact of taxes. The backtested data does not account for any additional fees and/or trading expenses that may have been incurred at the custodial level. The strategy calls for a precise asset allocation formula as follows: Jan. 1 to late-October: 70% intermediate-term bond funds / 30% short-term bond funds; late-October to Dec. 31: 40% intermediate-term bond funds + three power period trades using a Russell 2000 Index fund leveraged by 50%. See brochure for details. The hypothetical data uses index returns for the Russell 2000 to calculate returns in the fourth quarter of each year. The Russell 2000 is an index which cannot be used in actual investing and index funds that replicate the Russell 2000 may vary from the index returns. The hypothetical data does not include interest and dividends attributed to the Russell 2000 index. No allowance for interest/dividends earned on 60% of the portfolio during the fourth quarter is included in the hypothetical data.

**Cautions:** The SEC mandates that we state: The investment strategy that the backtested results were based upon can (theoretically) be changed at any time with the benefit of hindsight in order to show better backtested results, and (theoretically) the strategy can continue to be tested and adjusted until the desired results are achieved. Please note that Alpha has not made any data-fitting adjustments to its managed account model. Even though the rules of the strategy are mechanical, objective, and fully disclosed, hypothetical models must be approached with caution because they are created with the benefit of hindsight and do not represent how the manager of the model may react under material economic and market conditions. Actual accounts may use funds which deviate from the indexes represented in the model illustration. No matter how positive the model returns have been over any time period, the potential for loss is always present due to factors in the future which may not be accounted for in the model. Investors should be aware that the use of leveraged funds for 20 days in the fourth quarter of each year increases the volatility and risk of the equity component of the strategy. Leverage can magnify the losses of an investment during a down market. Given the potential risks involved, strategies employing leverage may not be suitable for all investors.
